

ORDER REQUIREMENTS

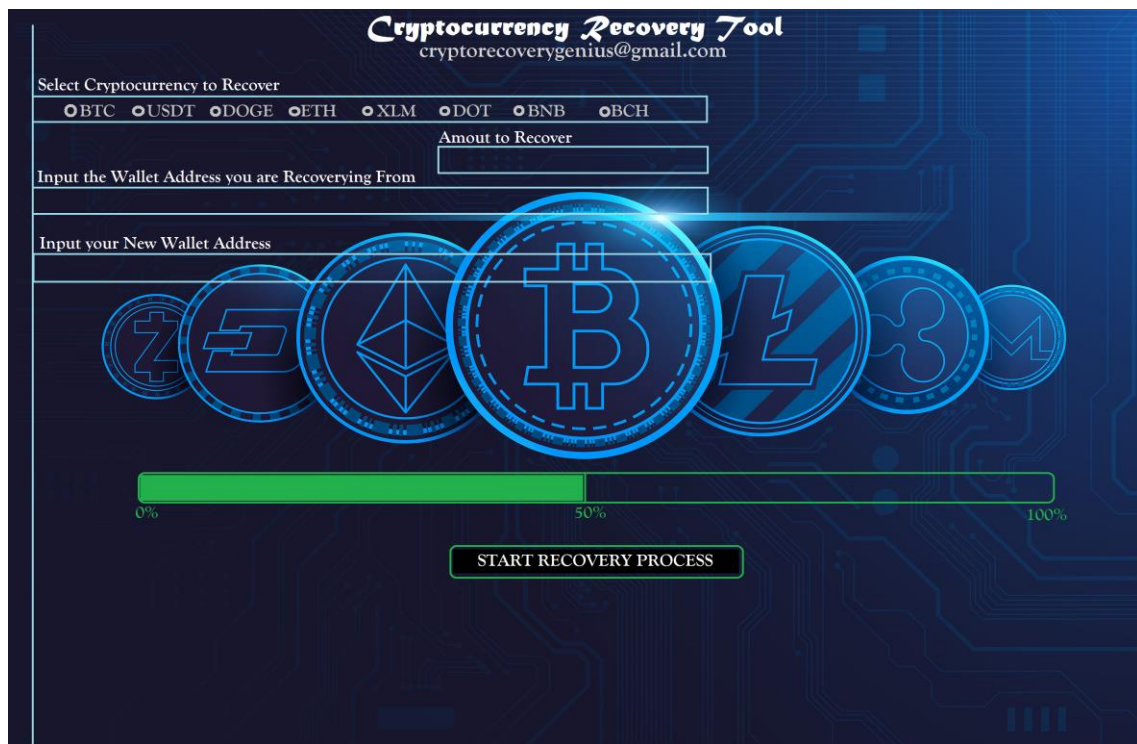

Hello, I received your offer for my request which I posted on "BUYERS REQUEST".

I am in need of a professional exploit tool developer. You should be highly knowledgeable in Virtual studio, Coding with Javascript, Python. Have a knowledge in building desktop apps.

Now this is what I want:

Create a windows application with the traits indicated in the picture below. I will point out some modifications to make to it.

Here is the picture and the background should be crypto something like this. What you see below was done by me and that is my email on it.

Let me explain how this tool will work.

1. First you choose the cryptocurrency you want to recover.
2. Put the amount you want to recover
3. Put the wallet address you want to recover from. (this is where you will have some research to do. All this 8 cryptocurrencies have a manner and a way in which their addresses are, so make sure that if someone chooses BTC and puts a USDT address below it should detect that wrong key. You can check the criteria for each wallet addresses online)
4. Put the new wallet you are recovering to.

When someone has put in all this information, and the tool detects that its correct, the person will then click “START RECOVERY PROCESS”. If the tool does not detect that the information above is correct the “START RECOVERY PROCESS” should not be activated.

Now once this is done, the process should begin and progress bar should begin loading.

I also need you to input a countdown bar. For example. If someone puts 30BTC in “Amount to Recover” box, there should be a countdown panel showing how the coins are gradually reducing from 30BTC in the old wallet to the new wallet. So if the progress bar is showing 50%, the countdown should show that 15btc has already been transferred.

VERY IMPORTANT PART: ONCE THE PROGRESS BAR REACHES 50% THE TOOL SHOULD STOP WORKING AND IT REQUEST FOR **AUTHENTICATION CODE**, SO AT 50% A BOX SHOULD APPEAR FOR THE CODE. ONLY ME WILL HAVE THIS CODES. ONCE THE CODE IS INPUTED THE PROCESS CONTINUES TILL 100%.

You will need to show me how to generate this codes.

(SO THE TOOL YOU ARE CREATING IS PRACTICALLY DOING NOTHING)
